# Final Exam S3
# Computer Architecture

**Duration: 1 hr. 30 min.**

## Exercise 1 (9 points)

All questions in this exercise are independent. **Except for the output registers, none of the data or address registers must be modified when the subroutine returns.** A string of characters always ends with a null character (the value zero). A blank character is either a space character or a tab character.

1. Write the **`IsBlank`** subroutine that determines if a character is blank (i.e. if it is a space or a tab character).
   Input : **D1.B** holds the ASCII code of the character to test.
   Output : If the character is blank, **D0.L** returns 0.
   If the character is not blank, **D0.L** returns 1.

   **Tip:** The ASCII code of the tab character is 9.

2. Write the **`BlankCount`** subroutine that returns the number of blank characters in a string. To know if a character is blank, use the **`IsBlank`** subroutine.
   Input : **A0.L** points to a string of character.
   Output : **D0.L** returns the number of blank characters in the string.

   **Tips:**
   - Use **D2** as a blank-character counter (because **D0** is used by **`IsBlank`**).
   - Then, copy **D2** into **D0** before returning from the subroutine.

3. Write the **`BlankToUnderscore`** subroutine that converts the blank characters in a string into underscore characters. To know if a character is blank, use the **`IsBlank`** subroutine.
   Input : **A0.L** points to a string of characters.
   Output : The blank characters of the string are replaced by the « _ » character.

## Exercise 2 (4 points)

Complete the table shown on the answer sheet. Write down the new values of the registers (except the **PC**) and memory that are modified by the instructions. **Use the hexadecimal representation. Memory and registers are reset to their initial values for each instruction.**

Initial values:

```
D0 = $0004FFFD   A0 = $00005000   PC = $00006000
D1 = $FFFF000A   A1 = $00005008
D2 = $FFFFFFFE   A2 = $00005010

$005000   54 AF 18 B9 E7 21 48 C0
$005008   C9 10 11 C8 D4 36 1F 88
$005010   13 79 01 80 42 1A 2D 49
```

## Exercise 3 (3 points)

Complete the table shown on the answer sheet. Give the result of the additions and the values of the **N**, **Z**, **V** and **C** flags.

## Exercise 4 (4 points)

Let us consider the following program:

```
Main        move.l  #$44AA77FF,d7

next1       moveq.l #1,d1
            tst.w   d7
            bmi     next2
            moveq.l #2,d1

next2       clr.l   d2
            move.w  #$1234,d0
loop2       addq.l  #1,d2
            subq.b  #1,d0
            bne     loop2

next3       clr.l   d3
            move.w  #$1234,d0
loop3       addq.l  #1,d3
            dbra    d0,loop3        ; DBRA = DBF

next4       moveq.l #1,d4
            cmp.b   #$70,d7
            blt     quit
            moveq.l #2,d4

quit        illegal
```

Complete the table shown on the answer sheet.

| EQ | equal | Z | LE | less or equal | (N ⊕ V) + Z |

Revised by Peter Csaszar, Lawrence Tech University – 2004-2006

**An** Address register (16/32-bit, n=0-7)
**Dn** Data register (8/16/32-bit, n=0-7)
**Rn** any data or address register
**s** Source, **d** Destination
**e** Either source or destination
**#n** Immediate data, **i** Displacement
**BCD** Binary Coded Decimal
↑ Effective address

**SSP** Supervisor Stack Pointer (32-bit)
**USP** User Stack Pointer (32-bit)
**SP** Active Stack Pointer (same as A7)
**PC** Program Counter (24-bit)

**SR** Status Register (16-bit)
**CCR** Condition Code Register (lower 8-bits of SR)
**N** negative, **Z** zero, **V** overflow, **C** carry, **X** extend
***** set according to operation's result, ≡ set directly
**-** not affected, **0** cleared, **1** set, **U** undefined

1 Long only; all others are byte only
2 Assembler calculates offset
3 Branch sizes: **.B** or **.S** -128 to +127 bytes, **.W** or **.L** -32768 to +32767 bytes
4 Assembler automatically uses A, I, Q or M form if possible. Use #n.L to prevent Quick optimization

Last name: ..... First name: ..... Group: .....

**ANSWER SHEET TO BE HANDED IN WITH THE SCRIPT**

**Exercise 2**

| Instruction | Memory | Register |
|---|---|---|
| Example | `$005000  54 AF 00 40 E7 21 48 C0` | A0 = `$00005004`<br>A1 = `$0000500C` |
| Example | `$005008  C9 10 11 C8 D4 36 FF 88` | No change |
| `MOVE.B  -1(A2),-(A1)` | | |
| `MOVE.L  $500E,-1(A1,D0.W)` | | |
| `MOVE.L  #$500E,-8(A0,D1.W)` | | |
| `MOVE.W  $500A(PC),-(A1)` | | |

**Exercise 3**

| Operation | Size (bits) | Result (hexadecimal) | N | Z | V | C |
|---|---|---|---|---|---|---|
| `$A3 + $5C` | 8 | | | | | |
| `$7005 + $7005` | 16 | | | | | |
| `$7FFFFFFF + $80000001` | 32 | | | | | |

**Exercise 4**

| Values of registers after the execution of the program.<br>**Use the 32-bit hexadecimal representation.** | |
|---|---|
| **D1** = $ | **D3** = $ |
| **D2** = $ | **D4** = $ |
